## Modular Construction Delivers Healthcare Faster

Seeking better, leaner building methods, the design and construction team for Cardiovascular Associates worked with BLOX to prefabricate the interior of a 60,000sf clinic. BLOX produced examination room modules, the main organizing elements of the plan. The BLOX prototype was used by doctors to test equipment layout and fine tune design before production.

While crews on site were building foundations and battling inclement weather, BLOX was busy constructing and finishing interior exam rooms inside a factory.

The exam rooms were built in two-room modules, complete

with drywall, cabinetry, plumbed sinks, lights, ceilings and paint. The controlled environment and assembly line allow for precision levels unparalleled on a jobsite, and reduce waste to almost zero.

When the clinic's site-built building shell was ready, BLOX wrapped, loaded, delivered and installed 24 finished exam rooms in just six days. The remaining exam rooms, identical in design but built on site using standard construction practices, would not be finished for another four months.
